

CONVERTIBLE VEHICLE

ABSTRACT OF THE INVENTION

A convertible vehicle with a roof having a roof covering and several lateral frame parts, which at least partially span the roof covering when roof is closed and follow each other in the longitudinal direction of the vehicle, in which a rear frame part extends from a window parapet line with an upward extending component. The adjacent frame part, preceding the rear frame part in the direction of travel when the roof is closed, can be moved without a force transfer through the rear frame part by at least one drive provided for roof opening, and the rear frame part is suspended on a gear mechanism that transfers the drive force and can be moved by it.
